Design

ALTIVS has been styled to keep up with all the luxury gadgets on the market at a fraction of the price.

Design combines its hydrodynamic body with elegant colors and textures based on the current automotive and boating trends as well as allowing for a high visibility.

Hydrodynamic Performance

ALTIVS is designed with a **93% efficient propulsion system**, which allows an industry-leading **370N thrust** delivered for up to 1 hour of runtime, all packed together into only **18kg** of weight. This is achieved through a stealth ducted impeller polarizing the outflow of water, making sure the battery power goes directly into propulsion without wasting any energy on noise and recirculation.

ALTIVS

We are very proud to introduce the first of its kind, light water scooter, capable of racing any rival, weighing in at less than a half of them.

5.5'' Smart Screen

For ease of navigation we've installed a high-res TFT display with a 5.5" diagonal, largest of any competitor. Screen will indicate key performance info such as runtime, speed level, battery %; as well as guide you with an e-compass, so you'd never lose the way back to the base. The LCD is powered by an Android hardware which will perform full diagnostics of the unit, record the rides using a GPS chip and allow uploading all trips and unit data to your mobile device using the SubblueGo platform. These features make Altivs not only a scooter but a smart companion for your trip.
